Algorithm

1. Store all n strings in a Hashset.
2. For each query string:
   i) Convert to char array
   ii) For every index i:
      - Save original char
      - Try replacing with other 2 chars
      - Check if modified string exists in set
      - Restore original char
3. If found then print "Yes"
4. Else print "No"

Code -

```
import java.io.*;
import java.util.*;
public class Main
    public static void main (String[] args)
    throws Exception {
        Scanner sc = new Scanner (System.in);
        int n = sc.nextInt();
        int m = sc.nextInt();
        HashSet<String> set = new HashSet<>();
        for (int i=0; i<n; i++){
            set.add (sc.next());
        }
        while (m-->0){
            String s = sc.next();
            boolean found = false;
            char[] arr = s.toCharArray();
            for (int i=0; i<arr.length && !found
                ; i++){
                char original = arr[i];
```

```
for (char ch : new char[]{'a', 'b', 'e'}){
    if (ch == original) continue;
    arr[i] = ch;
    String modified = new String(arr
    if (set.contains(modified)){
        found = true;
        break;
    }
  }
  arr[i] = original;
}
if (found) {
    System.out.println("YES");
}else {
    System.out.println("NO");
}
}
sc.close();
}
}
```
